

uni_one
TECHNOLOGY

Technology for Window revolution

wood - aluminium frames

from 6-meter finished wooden bars

reduced traditional production costs

Production technology

uni_one uses a production technology created to produce wood-aluminium frames, using pre-finished 6-meter bars that are ready to be cut and assembled.

uni_one is a technological system that allows the producer to simplify, optimize and implement his own production.

Thanks to this technology, windows can be produced quickly and with lower costs, with no expensive production plants nor highly-skilled woodworking staff.

Materials

Comfort and well-being inside, resistance and protection outside.
Thanks to the combination of wood and aluminium, the window becomes a decorative furnishing element that does not require external maintenance.

Wood

Warm, stylish, renewable and natural, wood is capable of enriching a room and creating a warm atmosphere. Our wood is protected and enriched with an easy-to-maintain Silk finish, which is highly resistant to impact, scratches and moisture, or, with our Natura finish in stainable Oak Veneer, which adds individuality to the frames, making them beautiful and unique.

Internal

Our glue-lam wood, due to its technical characteristics and stability, is ideal for constructing door and window frames. It is characterised by good workability and durability. The type of wood used contains a higher proportion of air, making it ideal for achieving high performance in thermal and acoustic insulation.

uni_one wood comes from renewable sources with FSC® certification and Chain of Custody - and is produced using glue-laminated bars technology, enabling optimization of this resource.

Aluminium

Our aluminium frames protect the wooden interior of the window, keeping it dry, sturdy and durable.

Our aluminium frames are produced using corner welding technology, which maximises strength, quality and appearance. Where corners cannot be welded, a mechanical joint is created by gluing and crimping, with support blocks beneath, for frames with anodised, wood-grain and metallic finishes.

External

Our external aluminium avoids the need for any type of maintenance and optimises the water-resistance and air-tightness of the windows, giving designers the best opportunity to express their creativity with optional designs and colours. The coating process carried out after welding ensures perfectly watertight corners, which are completely protected by the paint and which improves the aesthetics of the finished product.

uni_one aluminium coating involves the following:

- immersion pre-treatment using closed-cycle chrome-free products;
- powder coating with furnace polymerisation.

The coating cycle is carried out according to the European QUALICOAT standard.

Wooden bars: the origin of everything

For the first time, wood-aluminium window and door are produced starting from a pre-machined and pre-finished 6-meter wooden bar.

The wooden bar is the quintessence of uni_one, the beating heart of its production technology.

During the initial production start-up phase, the supply of pre-assembled wooden frames is also available, for greater customer support.

Natural Revolution

Natural: like wood.

Revolution: like revolutionary production technology.

With uni_one, nature is enhanced by engineering technology and a revolutionary production method that overturns the rules of the traditional production of wood-aluminium window and door.

uni_one Technology

uni_one technology is an original thought, a philosophy, a method. We have developed it by converting years of technological evolution into a few steps. Our synthesis: fast and accurate processing machinery, aluminium and glue-lam wood profiles with Silk and Natura finishes, dedicated software and a sales tool kit.

SIMPLE

It all starts from a 6-meter wooden bar.
The major innovation introduced by uni_one technology is the ease of management and production of door and window frames, in addition to an extremely simple profile assembly system.

FAST

Fast and accurate processing, thanks to the CNC processing centre, developed to produce all uni_one timber components.

**THE RIGHT
VALUE**

Manufacturing using uni_one technology is economic because, unlike other production systems, it does not require expensive production plants and not highly-skilled woodworking staff.

COMPLETE

A unique production technology that fully supports the window manufacturer. From the design stage, using dedicated software, to the production of the finished window. uni_one manufacturers can rely on a team of experts for training and the availability of a wide range of sales tools to present the product effectively.

uni_one turnkey workshop

For the processing of all uni_one wood and aluminium components, Uniform has developed a fast and accurate work methodology and a collection of complementary equipment for assembling and crimping frames. uni_one technology provides immediate entry into the production reality of high quality windows, in order to respond to an increasingly demanding and dynamic market.

**REDUCED PRODUCTION
COSTS**

**REDUCED
OVERALL DIMENSIONS**

**6-METER FINISHED
WOODEN BARS**

**WOODWORKING SKILLS
NOT REQUIRED**

Pro-F2 software

Pro-F2 uni_one is the software used for the development of quotations and orders: it is intuitive and easy to use, thanks to its interface, which guides the operator step by step, provides for the compilation and automatic printing of all CE marking-related documentation, including pre-customised labels with order and service references.

MC-900 CNC machining center for wood profiles

CNC center for machining wooden profiles, connected to the dedicated software to carry out the processing of all uni_one wood profiles.

MC-062 assembly bench

Bench for assembling uni_one wooden profiles. Through pneumatic manual controls, it enables the locking of the crosspieces and uprights of the frames to assemble the corners using screws in horizontal position.

LACV-98 vertical crimping machine

A pneumatic vertical crimping machine with a self-centring device on the corner joint for the mechanical assembly of aluminium profiles.

Start-up Formula

The start-up formula involves the supply of pre-assembled wooden frames, with or without assembled hardware and the supply of software, for one-year rental, for developing contracts. It is specifically designed to offer technical and production support, especially during the early stages of production start-up.

Support and training

A team of professionals and technicians is available to provide training, support and to guide the installation and start-up of the software and production workshop, step-by-step.

Sales tools

In order to take on the market successfully, we provide you with an effective and complete set of sales tools, including display stands, wood and aluminium finish cases, customisable corner samples and brochures.

uni_one: evident quality

All uni_one systems range is certified and guaranteed for 10 years

QUALITY GUARANTEES

Perfect adhesion of veneer films on uni_one glue-lam wooden profiles

Resistance to corrosion phenomena in the coating of aluminium products

relating to frame systems in the catalogue, due to exposure to normal weather conditions and coastal environments

No mechanical breakages of metal accessories, in plastic material and no wear and tear of gaskets

Always attentive to the environment

For the uni_one bars, Uniform uses only wood derived from FSC® certified forests in order to support the principles of sustainability and respect for both mankind and nature. In addition, production using laminate technology optimises the use of timber resources, by minimising waste.

Absolute quality in the treatment of aluminium

Uniform regularly conducts accelerated ageing and corrosion-resistance tests in highly critical atmospheres, regulated according to European legislation and by following the parameters set by the QUALICOAT standard.

Total cascading safety

For uni_one frames, Uniform provides cascading ITT, integrating it into the development software and has produced a series of CE marking support documents, enabling customers to quickly and fully meet all regulatory requirements. The cascading mechanism comprises the following components:

The contract

Thanks to the cascading mechanism, a licence agreement can be signed with Uniform S.p.A., in accordance with the requirements of the relevant legislation.

Test reports

Once the agreement has been signed, Uniform shall provide a copy of all test reports, conducted on uni_one frames, according to the standard EN 14351-1.

User and maintenance manual

Uniform provides an elegant booklet, also supplied in a customisable format, containing the information that the window manufacturers need to convey to the end users.

Performance declaration and CE marking

Documents are provided in file and customisable format, drawn up in accordance with European Regulation CPR no. 305/11 and with the EN 1435-1 standard, which can be filled in easily and immediately (CE conformity declaration) (CE marking).

The benefits of uni_one Technology

Structural wood-glass bonding

Glass, glued to the wooden structure using structural double-sided adhesive tape, makes the window dimensionally stable and rigid at all times, which enables much larger and brighter openings to be created. The structural bonding of the glass to the wood distributes the load in a linear manner, eliminates tension peaks on the panels and prevents deformations on the glass. The structural bonding also improves thermal and acoustic insulation, ensures greater burglary protection, maximum safety and functionality for the entire life of the frame.

Coupling of aluminium frames on wood

Aluminium frames are joined to the wood using screwed nylon clips. The clips are snapped together on the profile, and by turning the clips using a special key, the frames can be disassembled.

External coating with welded corners

Our aluminium frames can be produced using corner welding technology, which guarantees maximum strength and quality.

External coating with mechanical joint

Our junction system using caulked aluminium corner joints is used for oxidised, wood-grain and metallic finishes frames. The mechanical joint provides a single corner joint (LS200) for all uni_one system aluminium profiles.

Aluminium

Coating process

Uniform uses a modern coating system that guarantees service quality and speed.

01 Qualicoat Seaside Pre-Treatment

Pre-treatment, performed according to the Qualicoat Seaside Cycle requirements, guarantees improved binding of the powder to prevent corrosion. The minimum surface removal is 2.0 g/m² (compared with the basic procedure, in which only 1.0 g/m² is removed).

02 Powder application

Polyester powders have a lasting effect and provide a high level of protection. They are applied by electrostatic attraction, ensuring uniform distribution over the entire surface, even in the most inaccessible areas.

03 Cross-Linking

After applying the powder, the pieces are immediately baked at a temperature of between 180° and 200°C for 20 minutes. The time guarantees the optimal polymerisation of the powders, with the creation of a solid, protective film.

Treatments on request

Welding Plus

The welding of the corners of frames, shutters and blinds intended for areas with an aggressive atmosphere (e.g.: coastal areas, urban areas and industrial areas with strong combustion gas emissions, railway areas, etc.) can be performed using a special technology developed by Uniform that counteracts corrosion. This treatment is known as WELDING PLUS and is carried out only upon specific request by the customer, following confirmation of the offer, in addition to the basic QUALICOAT SEASIDE pre-treatment.

Mechanical and corrosion tests

Uniform conducts regular tests according to European legislation in compliance with the requirements imposed by the Qualicoat standard, an organisation that manages a quality brand of aluminium and its alloys for architectural applications.

Paint adherence

Impact-resistance test

Coating thickness

Shine test

Deep drawing test

Machu test

Bend testing

**Acetic salt for
resistance test**

Class 2 powder

In areas with Annual Average Solar Radiation greater than 5,400 MJ/m² and, especially, in areas with an aggressive atmosphere (e.g.: coastal areas, urban areas and industrial areas with strong combustion gas emissions, railway areas, etc.), a Class 2 Qualicoat polyester powder can be used, which is more resistant to atmospheric agents than Class 1 powder.

Class 2 powder is applied only upon specific customer request following confirmation of the offer and availability of the desired RAL (the Class 2 colour range is more limited than for Class 1).

SILK

Technical Essence

- Silk is a latest-generation single-layer finish, printed with synchronised grain texture.
- Used in the most prestigious contemporary furnishings.
- It gives more value to your window, creating a perfect harmony with the furniture and doors in client's surroundings.
- High resistance to impact, scratches, humidity and stains, offering a perfect inalterability of colour when exposed to light.

NATURA

Emotion and material sensory aspects

- The Natura Oak Veneer finish adds materiality to frames, making them authentically elegant.
- It uses the "first trunk selection", which is the most valuable part of the wood, to achieve uniformity of the wood grain.
- Warm and stylish. Wood fits into any environment and style giving your home a timeless value.
- Available in different colours to match windows to floors and interior doors.
- 100% renewable, fully respecting of man and nature.

OAK VENEER

Materials and Design

The glue-lam wood gives to uni_one frame excellent qualities of mechanical resistance, dimensional stability and insulation.

The external coated aluminium frame does not require any type of maintenance and optimises its air-tightness and water-tightness.

The uni_one frame guarantees the best performance and maximum well-being, without the use of environmentally harmful products, in full respect of nature.

Pure lines and refined design. uni_one is a window in harmony with contemporary architectural design trends. The wood finishes, inspired by the most prestigious interior brands, create a harmonious environment with the doors and interior furnishings of the home.

Thanks to the minimal style, light becomes a natural element of furniture, a perfect balance between nature, aesthetics and technology.

The uni_one system is suitable for the most diverse different architectures and climatic situations. UNI as in universal, is capable of being the perfect furnishing accessory in any environment and in any context.

The thermal transmittance values are calculated according to UNI EN 10077/1-2018, UNI EN 10077/2-2018, UNI EN 10456-2008, UNI EN 673-2011 standards, in reference to a window with 1 sash WxH (1230x1480mm, $\psi_g = 0,04$ W/mK)

The air-water-wind tightness performances are estimated in reference to a window with 2 sashes WxH (1500x1500mm)

The acoustic insulation values are estimated in reference to a window with 1 sash WxH (1230x1480mm)

The Group: Uniform S.p.A.

Technological innovation, quality of materials, energy efficiency, sustainability and respect for mankind and nature.

These principles form the basis of Uniform's business culture and, since the foundation of the company in 1988, have contributed to create a wide range of products with customised solutions and a service aimed at full customer satisfaction.

A leading company in the production of wood-aluminium frame systems, Uniform has developed synergistic products with the aim of becoming the benchmark for both frame manufacturers and operators in the construction and architecture sectors.

Thanks to its highly-specialised in-house team, Uniform is capable of offering advice and support to window manufacturing customers in all phases involved in the design and production of their products.
